<b>1</b>	<b>The Methodology of Statistical Mechanics</b>	<b>1</b>
1.1	Terminology and Methodology . . . . .	1
1.1.1	Approaches to the subject . . . . .	1
1.1.2	Description of states . . . . .	2
1.1.3	Extensivity and the Thermodynamic Limit . . . . .	3
1.2	The Fundamental Principles . . . . .	4
1.2.1	The Laws of Thermodynamics . . . . .	4
1.2.2	Probabilistic interpretation of the First Law . . . . .	5
1.2.3	Microscopic Basis for Entropy . . . . .	7
1.3	Interactions – The Conditions for Equilibrium . . . . .	7
1.3.1	Thermal Interaction – Temperature . . . . .	8
1.3.2	Volume change – Pressure . . . . .	10
1.3.3	Particle interchange – chemical potential . . . . .	12
1.3.4	Thermal interaction with the rest of the world – the Boltzmann factor . . . . .	13
1.3.5	Particle and energy exchange with the rest of the world – the Gibbs factor . . . . .	15
1.4	Thermodynamic Averages . . . . .	17
1.4.1	The Partition Function . . . . .	17
1.4.2	Gibbs Expression for Entropy . . . . .	17
1.4.3	Free Energy . . . . .	19
1.4.4	Thermodynamic Variables . . . . .	20
1.4.5	The beta trick . . . . .	21
1.4.6	Fluctuations . . . . .	22
1.4.7	The Grand Partition Function . . . . .	24
1.4.8	The Grand Potential . . . . .	25
1.4.9	Thermodynamic variables . . . . .	26
1.5	Quantum Distributions . . . . .	27
1.5.1	Bosons and Fermions . . . . .	27
1.5.2	Grand Potential for Identical Particles . . . . .	29

1.5.3	The Fermi-Dirac Distribution . . . . .	30
1.5.4	The Bose-Einstein Distribution . . . . .	31
1.5.5	The Classical Limit – The Maxwell-Boltzmann Distribution . . . . .	32
1.6	Classical Statistical Mechanics . . . . .	33
1.6.1	Phase Space and Classical States . . . . .	33
1.6.2	Boltzmann and Gibbs Phase Spaces . . . . .	35
1.6.3	The Fundamental Postulate in the Classical Case . . . . .	36
1.6.4	The classical partition function . . . . .	36
1.6.5	The equipartition theorem . . . . .	36
1.6.6	Consequences of equipartition . . . . .	38
1.6.7	Liouville’s theorem . . . . .	40
1.6.8	Boltzmann’s $H$ theorem . . . . .	41
1.7	The Third Law of thermodynamics . . . . .	43
1.7.1	History of the Third Law . . . . .	43
1.7.2	Entropy . . . . .	44
1.7.3	Quantum viewpoint . . . . .	45
1.7.4	Unattainability of absolute zero . . . . .	47
1.7.5	Heat capacity at low temperatures . . . . .	47
1.7.6	Other consequences of the Third Law . . . . .	49
1.7.7	Pessimist’s statement of the laws of thermodynamics . . . . .	51
	Bibliography . . . . .	54
<b>2</b>	<b>Practical Calculations with Ideal Systems</b>	<b>57</b>
2.1	The Density of States . . . . .	57
2.1.1	Non-interacting systems . . . . .	57
2.1.2	Converting sums to integrals . . . . .	57
2.1.3	Enumeration of states . . . . .	58
2.1.4	Counting states . . . . .	59
2.1.5	General expression for the density of states . . . . .	61
2.1.6	General relation between pressure and energy . . . . .	62
2.2	Identical Particles . . . . .	64
2.2.1	Indistinguishability . . . . .	64
2.2.2	Classical approximation . . . . .	65
2.3	The Ideal Gas . . . . .	65
2.3.1	Quantum approach . . . . .	65
2.3.2	Classical approach . . . . .	67
2.3.3	Thermodynamic properties . . . . .	67
2.3.4	The $1/N!$ term in the partition function . . . . .	69
2.3.5	Entropy of mixing . . . . .	70
2.4	The Quantum Gas . . . . .	72

2.4.1	Methodology for quantum gases . . . . .	72
2.5	Fermi Gas at Low Temperatures . . . . .	74
2.5.1	Ideal Fermi gas at zero temperature . . . . .	74
2.5.2	Fermi gas at low temperatures – simple model . . . . .	77
2.5.3	Fermi gas at low temperatures – series expansion . . . . .	79
2.5.4	More general treatment of low temperature heat capacity . . . . .	85
2.6	Bose Gas at Low Temperatures . . . . .	88
2.6.1	General procedure for treating the Bose gas . . . . .	88
2.6.2	Ground state occupation . . . . .	89
2.6.3	Number of particles – chemical potential . . . . .	90
2.6.4	Low temperature behaviour of Bose gas . . . . .	90
2.6.5	Thermal capacity of Bose gas – below $T_c$ . . . . .	93
2.6.6	Comparison with Superfluid $^4\text{He}$ and other systems . . . . .	94
2.6.7	Two-fluid model of superfluid $^4\text{He}$ . . . . .	96
2.6.8	Elementary excitations . . . . .	98
2.7	Quantum Gas at High Temperatures – the Classical Limit . . . . .	99
2.7.1	General treatment for Fermi, Bose and Maxwell Cases . . . . .	99
2.7.2	Quantum energy parameter . . . . .	100
2.7.3	Chemical potential . . . . .	101
2.7.4	Internal energy . . . . .	102
2.7.5	Equation of state . . . . .	103
2.8	Black body radiation – the photon gas . . . . .	103
2.8.1	Photons as quantized electromagnetic waves . . . . .	103
2.8.2	Photons in thermal equilibrium – black body radiation . . . . .	105
2.8.3	Planck’s formula . . . . .	106
2.8.4	Internal energy and heat capacity . . . . .	107
2.8.5	Black body radiation in one dimension – Johnson noise . . . . .	109
2.9	Ideal Paramagnet . . . . .	111
2.9.1	Partition function and free energy . . . . .	111
2.9.2	Thermodynamic properties . . . . .	112
2.9.3	Negative temperatures . . . . .	116
2.9.4	Thermodynamics of negative temperatures . . . . .	118
2.10	Fermi gas magnetic susceptibility . . . . .	121
2.10.1	Magnetization at zero temperature . . . . .	121
2.11	Atoms in a harmonic trap . . . . .	122
2.11.1	Enumeration and counting of states . . . . .	123
2.11.2	Fermi energy – fermions . . . . .	125
	Bibliography . . . . .	130

<b>3</b>	<b>Non-ideal Gases</b>	<b>133</b>
3.1	Statistical Mechanics of Interacting Particles . . . . .	133
3.1.1	The partition function . . . . .	133
3.1.2	Cluster expansion . . . . .	134
3.1.3	Low density approximation . . . . .	135
3.1.4	Equation of state . . . . .	137
3.2	The Virial Expansion . . . . .	137
3.2.1	Virial coefficients . . . . .	137
3.2.2	Hard core potential . . . . .	138
3.2.3	Square-well potential . . . . .	140
3.2.4	Lennard-Jones potential . . . . .	141
3.2.5	The Sutherland potential . . . . .	145
3.2.6	Comparison of models . . . . .	148
3.2.7	Universal behaviour . . . . .	149
3.2.8	Quantum gases – the special case(s) of helium . . . . .	150
3.3	Thermodynamics . . . . .	154
3.3.1	Throttling . . . . .	154
3.3.2	Joule-Thomson coefficient . . . . .	156
3.3.3	Connection with the second virial coefficient . . . . .	157
3.3.4	Inversion temperature . . . . .	158
3.4	Van der Waals Equation of State . . . . .	159
3.4.1	Approximating the Partition Function . . . . .	159
3.4.2	Van der Waals Equation . . . . .	160
3.4.3	Estimation of van der Waals Parameters . . . . .	162
3.4.4	Virial Expansion . . . . .	163
3.5	Other Phenomenological Equations of State . . . . .	164
3.5.1	The Dieterici equation . . . . .	164
3.5.2	The Berthelot equation . . . . .	165
3.5.3	The Redlich-Kwong equation . . . . .	165
3.6	Hard Sphere Gas . . . . .	166
3.6.1	Possible approaches . . . . .	166
3.6.2	Hard Sphere Equation of state . . . . .	168
3.6.3	Virial Expansion . . . . .	169
3.6.4	Virial Coefficients . . . . .	169
3.6.5	Carnahan and Starling procedure . . . . .	170
3.6.6	Padé approximants . . . . .	173
3.7	Bridge to the next chapter . . . . .	175
3.7.1	Van der Waals model . . . . .	177
3.7.2	Hard sphere model . . . . .	177
3.7.3	Other bit – Tabulation of - - - - - . . . . .	181
	Bibliography . . . . .	186

<b>4</b>	<b>Phase Transitions</b>	<b>189</b>
4.1	Phenomenology . . . . .	189
4.1.1	Basic ideas . . . . .	189
4.1.2	Phase diagrams . . . . .	191
4.1.3	Symmetry . . . . .	193
4.1.4	Order of phase transitions . . . . .	194
4.1.5	The order parameter . . . . .	195
4.1.6	Conserved and non-conserved order parameters . . . . .	197
4.1.7	Critical exponents . . . . .	197
4.1.8	The scaling hypothesis . . . . .	199
4.1.9	Scaling of the free energy . . . . .	203
4.2	First order transition – an example . . . . .	204
4.2.1	Coexistence . . . . .	204
4.2.2	Van der Waals fluid . . . . .	206
4.2.3	The Maxwell construction . . . . .	208
4.2.4	The critical point . . . . .	211
4.2.5	Corresponding states . . . . .	211
4.2.6	Dieterici’s equation . . . . .	213
4.2.7	Quantum mechanical effects . . . . .	214
4.3	Second order transition – an example . . . . .	216
4.3.1	The ferromagnet . . . . .	216
4.3.2	The Weiss model . . . . .	217
4.3.3	Spontaneous magnetization . . . . .	219
4.3.4	Critical behaviour . . . . .	221
4.3.5	Magnetic susceptibility . . . . .	222
4.3.6	The ground state and Goldstone modes . . . . .	224
4.4	The Ising and other models . . . . .	226
4.4.1	Ubiquity of the Ising model . . . . .	226
4.4.2	Magnetic case of the Ising model . . . . .	228
4.4.3	Ising model in one dimension . . . . .	229
4.4.4	Ising model in two dimensions . . . . .	230
4.4.5	Mean field critical exponents . . . . .	232
4.4.6	The XY model . . . . .	235
4.4.7	The spherical model . . . . .	235
4.4.8	Universality classes . . . . .	236
4.5	Landau theory of phase transitions . . . . .	236
4.5.1	Landau free energy . . . . .	236
4.5.2	Landau free energy for the ferromagnet . . . . .	237
4.5.3	Landau theory – second order transitions . . . . .	241
4.5.4	Thermal capacity in the Landau model . . . . .	243
4.5.5	Ferromagnet in a magnetic field (really the Ising magnet) 244	244

4.6	Ferroelectricity . . . . .	246
4.6.1	Description of the phenomenon . . . . .	246
4.6.2	Landau free energy . . . . .	247
4.6.3	Second order case . . . . .	249
4.6.4	First order case . . . . .	250
4.6.5	Entropy and latent heat at the transition . . . . .	254
4.6.6	Soft modes . . . . .	255
4.7	Binary mixtures . . . . .	256
4.7.1	Basic ideas . . . . .	256
4.7.2	Model calculation . . . . .	257
4.7.3	System energy . . . . .	257
4.7.4	Entropy . . . . .	259
4.7.5	Free energy . . . . .	259
4.7.6	Phase separation – the lever rule . . . . .	261
4.7.7	Phase separation curve—the binodal . . . . .	262
4.7.8	The spinodal curve . . . . .	264
4.7.9	Entropy in the ordered phase . . . . .	265
4.7.10	Thermal capacity in the ordered phase . . . . .	266
4.7.11	Order of the transition and the critical point . . . . .	268
4.7.12	The critical exponent $\beta$ . . . . .	269
4.8	Quantum Phase Transitions . . . . .	271
4.8.1	Introduction . . . . .	271
4.8.2	The transverse Ising model . . . . .	272
4.8.3	Recap of mean field Ising model . . . . .	273
4.8.4	Application of a transverse field . . . . .	275
4.8.5	Transition temperature . . . . .	276
4.8.6	Quantum critical behaviour . . . . .	277
4.8.7	Dimensionality and critical exponents . . . . .	278
4.9	Retrospective . . . . .	280
4.9.1	The existence of order . . . . .	280
4.9.2	Validity of mean field theory . . . . .	282
4.9.3	Features of Different Phase Transition Models . . . . .	282
	Bibliography . . . . .	288
<b>5</b>	<b>Fluctuations and Dynamics</b>	<b>291</b>
5.1	Fluctuations . . . . .	292
5.1.1	Probability distribution functions . . . . .	292
5.1.2	Average behaviour of fluctuations . . . . .	294
5.1.3	The autocorrelation function . . . . .	298
5.1.4	The correlation time . . . . .	300
5.1.5	Spectral Density – the Wiener-Khintchine Theorem . . . . .	301

5.2	Brownian Motion . . . . .	303
5.2.1	Kinematics of a Brownian particle . . . . .	304
5.2.2	Short time limit . . . . .	306
5.2.3	Long time limit . . . . .	307
5.2.4	Equipartition . . . . .	309
5.3	Langevin's Equation . . . . .	309
5.3.1	Introduction . . . . .	309
5.3.2	Separation of forces . . . . .	310
5.3.3	The Langevin equation . . . . .	312
5.3.4	Velocity autocorrelation function . . . . .	314
5.3.5	Mean square velocity and equipartition . . . . .	315
5.3.6	Diffusion Coefficient . . . . .	315
5.3.7	Harmonically bound particle . . . . .	316
5.3.8	Equipartition and mean-square values . . . . .	318
5.3.9	Electrical analogue of the Langevin equation . . . . .	320
5.4	Linear Response I – Phenomenology . . . . .	321
5.4.1	Definitions and assumptions . . . . .	321
5.4.2	Response to a harmonic excitation . . . . .	324
5.4.3	Fourier representation . . . . .	326
5.4.4	Response to a step excitation . . . . .	327
5.4.5	Response to a “shock” or delta function excitation . . . . .	328
5.4.6	*Response to a Noise Excitation . . . . .	329
5.4.7	Consequence of the reality of $X(t)$ . . . . .	331
5.4.8	Consequence of causality ????? . . . . .	332
5.4.9	Consequence of causality . . . . .	334
5.4.10	Energy considerations . . . . .	336
5.4.11	Static susceptibility . . . . .	337
5.4.12	Relaxation time approximation . . . . .	339
5.5	Linear Response II – Microscopics . . . . .	340
5.5.1	Onsager's hypothesis . . . . .	340
5.5.2	Nyquist's Theorem . . . . .	342
5.5.3	Calculation of the step response function . . . . .	343
5.5.4	Calculation of the autocorrelation function . . . . .	345
	Bibliography . . . . .	349
<b>A</b>	<b>The Gibbs-Duhem Relation</b> . . . . .	<b>351</b>
A.1	Homogeneity of the fundamental relation . . . . .	351
A.2	The Euler relation . . . . .	351
A.3	Two caveats . . . . .	352
A.4	The Gibbs–Duhem relation . . . . .	352

<b>B</b>	<b>Thermodynamic Potentials</b>	<b>355</b>
B.1	Equilibrium states . . . . .	355
B.2	Constant temperature and volume: the Helmholtz potential . . . . .	357
B.3	Constant pressure and energy: the Enthalpy function . . . . .	358
B.4	Constant pressure and temperature: the Gibbs free energy . . . . .	359
B.5	Differential expressions for the potentials . . . . .	359
B.6	Natural variables and the Maxwell relations . . . . .	360
<b>C</b>	<b>Mathematica notebooks</b>	<b>363</b>
C.1	Chemical potential of a Fermi gas at low temperatures – Sommerfeld expansion . . . . .	363
C.2	Internal energy of a Fermi gas at low temperatures – Sommerfeld expansion . . . . .	364
<b>D</b>	<b>Evaluation of the Correlation Function Integral</b>	<b>367</b>
